a new framework

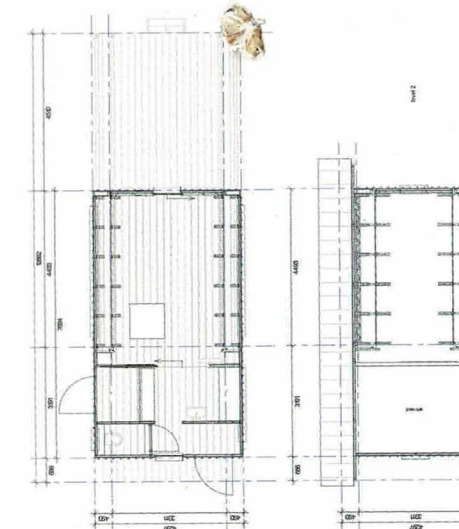

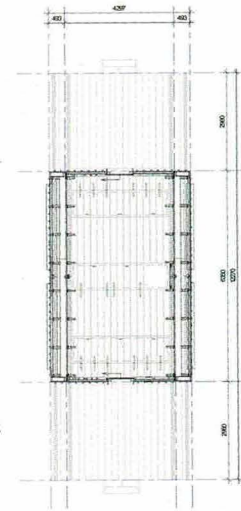

transforms
on a whim

A new flatpacked house responds to the task or even to the weather to create interesting and useful spaces

The landscaping around the 180 sq. m barn is simple yet effective, incorporating silver birch trees and wild meadow flowers that soften and meld the building with the established coastal vegetation and surrounding mature trees

A request from his mother to build a flexible garden space that could be used for “dinner parties, art or even theatrical performances” led Casper Schols to design and build his *Garden House* in 2016. The innovative project with movable walls attracted so much attention, including winning various notable accolades, that he was awarded a scholarship to study at the Architectural Association in London as well as receiving the financial backing to develop the idea. Five years on and he has just launched the ANNA Stay, ANNA Meet and a fully bespoke option, ANNA Me. “ANNA is a dynamic home in the shape of an open platform to live with, rather than against, the elements by playing with the configuration of the layers of the house,” he explains. “Just like the way you dress yourself to suit different weather conditions, occasions and moods.” The ANNA Stay has a fixed area, housing the kitchen, shower, toilet and storage space. Above the kitchen there is a mezzanine which is large enough for a second king-sized bed, making the house suitable for four. ANNA Meet was designed to adapt to activities such as yoga, whatever the weather. Both models are built in sustainably grown and untreated larch with birch ply used for the interior. When the wood shells are closed there is a cosy indoor atmosphere, “for moments when the weather is more hostile.” Delivered as one piece or as a flat pack consisting of 26 parts, it is built on easy to remove 1.5m long steel pillars, meaning the cabin can be relocated at any time, leaving nothing behind. All models are available for both on and off grid and start at €87,000. Cabin-ANNA.com
